The invention relates to human nucleic acids (AAI57788-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy brager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotectic/chemokincitc activity, hemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and CNN S discretes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human: bone marrow; antiinflammatory; cytostatic; neuroprotective; antiviral; antibacterial; antifungal; anti-HIV; haemostatic; immunosuppressive; gene therapy; cytokine cell proliferation; cell differentiation modulator; immune disorder; infection; cancer; human immunodeficiency virus; HIV; autoimmune disorder; haemophilia; ss.

                                                                                                                                                                     polypeptide encoded by it are useful in the treatment of various polypeptide encoded by it are useful in the treatment of various immune deficiencies and disorders. The deficiencies and disorders may be genetic, may be caused by a viral (e.g. HIV), bacterial or fungal infection, or may result from an autoimmune disorder, a coagulation disorder (e.g. haemophilia), inhibition of tumour cell proliferation, system disorder such as Alzheimer's disease. Detection of the presence or increased expression of the polynucleotide or the protein it encodes is useful for the diagnosis and/or prognosis of one or more types of cancer. The polynucleotide and polypeptide can be used as nutritional sources or supplements and in the screening of

                                                                                                                                                               The invention relates to human nucleic acids (AAI57788-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, the encoded polypeptides (AAM38642-AAM42213) with nootropic, immuosuppressant and cytoStatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous injuries, peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic laceral sciencisis, and Shy Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            OD.
The present sequence is one of 251 novel human polynucleotides capressed in the bone marrow. The polynucleotide and the polypeptide encoded by it are useful in the treatment of various polypeptide encoded by it are useful in the treatment of various compared to the properties and disorders. The deficiencies and disorders may be genetic, may be caused by a viral (e.g. HIV), bacterial or fungal infection, or may result from an autoimmune disorder, a coagulation disorder (e.g. haemophilia), inhibition of tumour cell proliferation, suppression of an inflammatory response or treatment of a nervous system disorder such as Alzheimer's disease, Detection of the presence or increased expression of the polynucleotide or the protein it encodes is useful for the diagnosis and/or prognosis of one or more types of cancer. The polynucleotide and polypeptide can be compounds as potential drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

  AAH57161 to AAH57576 represent cell and tissue specific polynucleotide sequences (I). (I) can have cytostatic, immunomodulatory and neuroprotective activities, and can be used in gene therapy. (I) and neuroprotective activities, and can be used in gene therapy. (I) and assays to select DNA molecules, RNA molecules, peptide nucleic acids, mimetics, peptides, proteins, agonists, antagonists, antibodies or their fragments, immunoglobulins, inhibitors, drug compounds and pharmaceutical agents. Expression of (I) in a sample indicates the differentiation of embryonic stem cells into a tissue selected from tissues. (I) and (II) are used to produce an expression profile that defines a metabolic or developmental process, treatment, condition, consistence or disorder. The gene profile can be used for diagnosis, or monitoring of treatments and for investigating a predisposition to a disorder where the gene is associated with a

                                                                                                                                                                                                                                                                                                  This is a partial nucleotide sequence of the gene (TCF2) encoding human hepatocyte nuclear factor 1 beta (HNF-1 beta, see AAW1581), a permecodomain-containing transcription factor. Mutations in this gene are indicative of a propensity to diabetes mellitus. The invention concerns the identification of genes responsible for diaperstand therapeutics. It demonstrates that the MODY3 locus is the HNF-1 alpha gene (see AAV5262), the MODY4 locus is the HNF-1 beta gene (see also AAV5230) and the MODY4 locus is the HNF-1 beta gene (see AAV52687). Analysis of mutations in these HNF genes can be diagnostic for diabetes. The invention also contemplates methods of screening for modulators of HNF function utilising HNF nucleic acids or polypeptides, the modulators being useful for treating diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                 Isolated nucleic acid encoding hepatocyte nuclear factor 1-alpha and 1-beta - useful for detecting susceptibility for non-insulin dependent diabetes, especially maturity-onset diabetes of the young

The present invention Jescribes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (AAV52134 to AAV52524) recorded on it. Or a representative fragment or a sequence at least 958 identical to SEQ ID No:1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 to 391 (AAV52134 to AAV52524) are genomic fragments from SEQ ID NO:1 to 391 (AAV52134 to AAV52524) are genomic fragments from claded nucleic acid molecule encoding a homologue of any of the fragments of the S.pheumoniae genome (SEQ ID NO:1 to 391) where the involeic acid molecule is produced by a process comptrising: (a) screening a genomic DNA library using as a process comptrising: (a) screening a genomic DNA library using as a process comptrising: (a) screening a genomic DNA library using as a process comptrising: (b) isolating coil the nucleic acid molecules that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating molecules whose nucleacide from an organism, amplifying nucleic acid molecules from the members of the computer or the amplification and isolating the amplified sequences. The computer fraget more processed by the content of the sequence is homologues to applier or the amplification and isolating the amplified sequences. The computer fraget readable medium can be used in a computer based system for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               fragments of the S. pneumoniae genome of commercial importance, or expression modulating fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, and pharmaceutical compositions and vaccines for S. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                  Computer-readable medium with recorded Streptococcus pneumoniae polynucleotide sequences - useful in diagnostic kits and assays, and pharmaceutical compositions and vaccines for Streptococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

This invention describes a novel method nucleic acid (1) and its encoded polypeptide (II) containing at least one region that encodes an enzymatic activity involved in biosynthesis of spinosyns. (1) are used (i) to dentify, inactivate or modulate genes involved in the biosynthesis of (II); (ii) to generate a library of polyketide synthases; (iii) for adding forosamine or trimethylthamnose to a spinosyn or polyketide adding forosamine or trimethylthamnose to a spinosy or polyketide enzymes, which are used for production of (II), their precursors or derivatives, including production of transgenic plants that express (II) and thus have increased resistance to insects. (I) are also useful as markers for sequencing of the Saccharopolyspora spinosa genome. (II) are markers for sequencing of the Saccharopolyspora spinosa genome. (II) are markers for sequencing of the Sacharopolyspora spinosa genome. (II) are also be used to raise specific antibodies, useful for identifying expression clones in a gene bank. Cells transformed with (I) may produce (II). This sequence represents a genomic DNA fragment of the S. spinosa genome which contains the coding regions for proteins involved in concamine and trimethylrhamnose blosynthesis.
                                                                                                                                                     New nucleic acid encoding enzymes for spinosyn biosynthesis, useful for recombinant production of insecticidal spinosyns and their derivatives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Forosamine; trimethylrhamnose; polyketide synthase; biosynthesis; spinosyn; polyketide aglycone; transgenic plant; insect resistance; macrolide; insecticidal; ds.

This invention describes a novel method nucleic acid (I) and its encoded polypeptide (II) containing at least one region that encodes an enzymatic activity involved in biosynthesis of spinosyns. (I) are used (i) to identify, inactivate or modulate genes involved in the biosynthesis of cidentify, inactivate or modulate genes involved in the biosynthesis of (II): (II) to generate a library of polyketide synthases; (II) for adding forosamine or trimethylithamnose to a spinosyn or polyketide egylycone; and (iv) for recombinant production of the corresponding caylycone; and (iv) for recombinant production of the corresponding carymes, which are used for production of (II), their precursors or derivatives, including production of (II), their precursors or and thus have increased resistance to insects. (I) are also useful as an arkers for sequencing of the Saccharopolyspora spinosa genome. (II) are as crivity, and can carcolides with insecticidal, but not antibacterial, activity, and can calso be used to raise specific antibodies, useful for identifying corresponding expression clones in a gene bank. Cells transformed with (I) may produce (II) at significantly increased levels or produce new derivatives of encome which contains the coding regions for produce in volved in corresponding transformed by the significantly correspondence of persents a genomic DNA fragment of the S. spinosa corrections involved in correspondence of persents and polyketide synthase biosynthesis.
                                                                                                New nucleic acid encoding enzymes for spinosyn biosynthesis, useful for recombinant production of insecticidal spinosyns and their derivatives
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 50000 BP; 8484 A; 16290 C; 16535 G; 8691 T; 0 other;

                                                                                                                                                                                                                                                         Ö:
                                                  This sequence encodes a human breast tumour protein immunogenic fragment of the invention. The polypeptides or nucleic acids encoding them are useful in vaccines and pharmaceutical compositions for manufacture of medicaments for inhibiting the development of breast cancer in a patient. They can also be used to treat breast cancer. Antibodies against these polypeptides can be used to detect and monitor progression of breast cancer in patients. Primers and probes derived from the polynucleotides encoding the breast proteins are useful for detection of breast cancer. Peripheral blood cells from a patient incubated in the presence of at least one polypeptide, such that T cells proliferate, are useful in manufacture of a medicament for treating breast cancer in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 aatggtagagtgtgtccctgagatggaatcagcttgagtcttctgcaattggtcacaact 360

The present sequence was isolated from a breast tumour cDNA library. It is provided in a specification relating to compounds for immunotherapy and diagnosts of breast cancer. Breast tumour antigens and the polynucleotides that encode them may be used in the production of a pharmaceutical composition to be used in the treatment of breast cancer. Proliferated T cells and incubated antigen presenting cells are also required. The polypeptides and polynucleotides may also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         300

conditions can be diagnosed by determining the amount of the new
polypeptides in a sample or by determining the presence of mutations in
the new polynucleotides. Specific uses are described for each of the 87
polynucleotides, based on which tissues they are most highly expressed in
(see AAX00611 for described uses).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin for portein as AAX00602) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 87 novel genes and their fragments (nucleic acid sequences: AAX00611 x00724; amino acid sequences AAX00611 which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin protein as compared to the human protein only.

The invention relates to 87 novel genes and their fragments (nucleic acid sequences: AAX00611-X00724; amino acid sequences AAX0611-X00724; amino acid sequences AAX0611-X00724; amino acid sequences AAX0611-X00724; acid sequences AAX0611-X00724; acid sequences AAX0611-X00724; and sequences AAX06101-X00724; conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the presence bf mutations in the new polynucleotides. Specific uses are described for each of the 87 polynucleotides, based on which tissues they are most highly expressed in conditions and acide aces.

The present sequence was isolated from a breast tumour cDNA library. It is provided in a specification relating to compounds for immunotherapy and diagnosis of breast cancer. Breast tumour antigens and the polynucleotides that encode them may be used in the production of a pharmaceutical composition to be used in the treatment of breast cancer. Proliferated I cells and incuibated antigen presenting cells are also required. The polypeptides and polynucleotides may also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A novel isolated polypeptide comprising an immunogenic portion of a breast cancer protein useful in the detection and treatment of breast cancer.

The invention relates to identifying tissue-specific polynucleotides (P) that involves performing a genetic subtraction to identify pool of (P) identify first subset of ITI), performing DNA microarray analysis to identify first subset of polynucleotides (SPI) at least 2-fold over expressed in II, and performing quantitative polymerase chain reaction (PCK) analysis on SPI to identify second subset of (P). The method is useful for determining the presence or absence of a cancer cell in a patient, monitoring the progression of cancer in a patient using a patient, monitoring the progression of cancer in a patient using a usine or a tumour biopsy sample. The methods are useful for determining the presence or absence of or monitoring progression of prostate, breast colon, ovarian, lung, head and neck, lymphoma, leukemia, melanoma, liver, gastric, kidney, bladder, pancreatic or endometrial cancer. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ss; human; BS106; breast tissue gene; breast cancer; detection marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240

                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                         BS106 is a breast tissue gene with which breast cancer and related diseases are associated. The BS106 polynucleotides AAV31989-V31953 can be detected by BS106 specific polynucleotides or complements acting as useful markers for detection methods. Peroducts and methods can be used for detecting, diagnosing, staging, preventing or treating, or determining predisposition to diseases or conditions of the breast such

AAX55582

```
sequences AAX55578-82 represent overlapping polynuclectide sequences of BS106 clones isolated from the breast tissue. The BS106 nucleic acids correspond to a breast tissue gene and can be used as markers for breast tissue disease. The products can be used for detecting, diagnosing, staging, monitoring, prognosticating, preventing or treating, or breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                180

The extended CDNAs (or genomic DNAs obtainable from them) may be used to prepare PCR primers and probes. These are useful for forensic matching or positive identification by DNA sequencing. They may also be used in alternative fingerprint identification techniques. Antibodies against the proteins encoded by the extended CDNAs are useful in identification of tissue types or cell species, as well as identifying tissue specific soluble proteins. The sequences can be used for chromosome mapping and identification of genes associated with hereditary diseases or drug response. Signal sequences from the CDNAs can be used in construction of construction of secretion vectors. Other sequences derived from the extended CDNAs can be used to clone upstream genomic DNA sequences including promoters. This is not unrun useful for identifying proteins that interact with promoter sequences. Some of the proteins may be useful in diagnosing and treating several disorders including, but not limited to: cancer, hyperlipidaemia, carding reconstruction of cardinary and provided the proteins may be useful in diagnosing and creating cardinary and provided the proteins may be useful in diagnosing and diseases, and cardinary disorders including, but not limited to: cancer, hyperlipidaemia.

     imaging
                                                         and
 invention relates to methods for diagnosing, monitoring, staging, imagi and treating breast cancer (BC). The methods comprise measuring the levels of BSG products in cells, tissues or body fluids of the patient and comparing the measured levels of BSG, with BSG levels of a normal human control. An antibody against the BSG sequences can be labelled an used for imaging BC in a patient. The antibody can be conjugated to a cytotoxic agent, and used for treating BC in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polypeptide; PRO polypeptide; LDL receptor; TIE ligand; receptor immunoadhesin; gene mapping; ss.

polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including LDL receptors. THE ligands and various enzymes. The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences.
                                                                                                                                                                                        will also be useful for the preparation of PRO polypeptides, especially by recombinant techniques.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes human secreted and transmembrane PRO proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bioactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mappling, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF4470 to AAF4470 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAF44081 to AAB65300 represent human PRO polynucleotide and protein sequences. AAF44081 to AAB65300 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      DL;

The invention relates to novel human anglogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding designated PRO proteins and so relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion proteins comprising a PRO protein, agonists or antagonists of a PRO protein, and compounds which inhibit the expression of a PRO gene. The invention additionally encompasses methods of identifying modulators of PRO expression or activity; diagnosing a cardiovascular, endothelial or anglogenic disorder, or a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a particular tissue; treating a cardiovascular, endothelial or anglogenic disorder via the administration of a PRO protein, PRO nucleic acid, or PRO ayonist the administration of a PRO protein, PRO nucleic acid, or PRO nucleic acid, and methods of inhibiting or stimulating endothelial administration of a PRO protein, or an agonist thereof. PRO nucleic acid, protein, or an agonist or antagonist thereof administration of a PRO protein, or an agonist or antagonist thereof cardiovascular, endothelial or anglogenic disorders, such as atherosclerosis, osteoporosis, myocardial infarction, hypertension, callacetto retinopathy, rheumatodia arthritis, crohn's disease, Huntington's disease, or stroke. PRO nucleic acids are additionally useful in the cacominant production of PRO proteins, as hybridisation probes to cardiovascular, endothelial or anglogenic disorders, such as encoding PRO proteins, to analyse genetic disorders, and in the crompathy. PRO nucleic acids are additionally useful in the development and screen bibraries to isolate cDNAs with sequence identity to PRO proteins, to analyse genetic disorders, and in an analyse genetic disorders, and in an analyse genetic disorders and an acids can allocate and and acids can also persented and and acids can also persented a
                                                                                                                                                        New isolated nucleic acid for producing a PRO polypeptide, analy genetic disorders and treating cardiovascular, endothellal or angiogenic disorders, such as atherosclerosis, wounds or cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       therapeutic agents. The present sequence represents

The BS106 polynuclectides AAV31989-V31993 can be detected by BS106 specific polynuclectides or complements acting as useful markers for detection methods. The products and methods can be used for detecting, diagnosing, staging, preventing or treating, or determining predisposition to diseases or conditions of the breast such as breast cancer.

Double-stranded CDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library went through one round of normalization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Contact: Robert Strausberg, Ph.D.

Am Klopierspitz 184 D-82152 Martinsried, Germany This is the 5' sequence of the clone insert clone from S. Wiemann, Molecular Genome Analysis, German Cancer Clone from S. Wiemann, Molecular Genome Analysis, German Cancer Research Center (DKF2); Email s.wiemand&Kf2- heidelberg.de; sequenced by EMBL (European Molecular Biology Laboratories, Heidelberg/Germany) within the CDNA sequencing consortium of the German Genome Project.

No sl sequence available.
Ihis clone (EKF2P761N0114) is available at the K2PD in Berlin, Please contact the R2PD: Ressourcenzentrum, Heubnerweg 6, 14059 Berlin-Charlottenburg, GERMANY; Email: clone@rzpd.de.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Following HAP puritication, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (closeIDs 1257096-1258631, 1469064-1470983, and 1475592-1476743). Subtraction by Bento Soares and M. Fatima Bonaldo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ad
                                                                                                                                                                                                                                                                                                                     Anote—Voctor: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; 1st strand cE:was prepared from mRNA obtained from Clontech Laboratories. Inc., and primed with a Not I - oligo(dI) primer [5]. TGTTACCAATGGGAGGGGCGCCCAATTITITITITIIII 3 ]. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digsted with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library went through one round of normalization to Cot5, and was constructed by Bento Soares and M. Fatima Bonaldo. **
